The closed-end data may be further segregated into various objectives including capital appreciation, convertible securities, country/regional, eastern European Union, emerging markets, fixed income, global, growth, growth & income, income & preferred stock, Latin American, muni bonds, Pacific excluding Japan, Pacific Region, sector equities, western European Union, and world income. The breakdown into groups based on objective is relevant in that the higher proportion of fixed income and muni bond funds may tend to skew the data. In addition, the further breakdown enables the analyst to more accurately match the minority family limited partnership interest being valued with a group of funds with similar composition or focus. The following table provides the count for the number of funds within each objective.

The descriptive statistics presented in the previous tables are relevant in helping the analyst determine the appropriate baseline discount from which adjustments may be made to determine the final discount applicable to the minority interest being valued. For example, for a well-diversified portfolio that includes domestic and international stocks as well as bonds, the analyst may decide to use the average or median discount for the entire population of the closed-end fund data as the appropriate baseline discount. From this, the analyst may increase or decrease the discount based on the portfolio's beta as compared to the average or median beta of the population data. Likewise, for a portfolio strictly of muni bonds or fixed income securities, the analyst may determine that the average or median discount for funds with that objective is more appropriate in determining a baseline discount. In the end, however, the analyst always must use reasoned and informed judgment in determining the appropriate baseline discount and the adjustment from that baseline to reflect the particular risk characteristics of the minority interest being valued.
